# NASA Exoplanet Exploration Program

Astrophysics Division, NASA Science Mission Directorate

*NASA's search for habitable planets and life beyond our solar system*

Program purpose described in  
**2014 NASA Science Plan**

- 1. Discover planets around other stars**
- 2. Characterize their properties**
- 3. Identify candidates that could harbor life**

ExEP serves the science community and NASA by implementing NASA's space science vision for exoplanets

## TESS – NASA Explorers Program (*launch 2018*)

**Science studies:**  
Survey most of sky for  
transiting exoplanets around  
bright & nearby stars

*Credit: NASA, GSFC, MIT*

## James Webb Space Telescope (*launch 2019*)

**Science studies:**  
General purpose infrared observatory  
("cosmic dark ages", galaxies, star formation, etc.)  
Will probe atmospheres of transiting exoplanets

*Credit: NASA, STScI*

# WFIRST

## Wide Field Infrared Survey Telescope

*(launch mid-2020s)*

**Science studies:**  
**Exoplanets via Microlensing**  
**Exoplanets via Direct Imaging**  
Dark Energy via Wide-field imaging of  
galaxies and supernovae

$\left\{ \begin{array}{l} \alpha \text{ Cen A/Rigel Kentaurus} \\ \alpha \text{ Cen B} \end{array} \right.$

Exoplanet Proxima Centauri b

# State of the Galaxy (*extrapolating* from recent surveys)

**Exoplanets are ubiquitous: *statistically* nearly every star likely has planets**

Sun-like stars typically have >5 planets

**“Super-Earths” and “sub-Neptunes” are more common than rocky planets (e.g. Earth) and gas giants (e.g. Jupiter)**

Planets form over a wide range of star properties, e.g. mass, luminosity, age, chemical composition, multiplicity

**Incidence of *exo-Earths* (rocky planets, 0.5-1.5x Earth size, in Habitable Zone) is area of active research: so far ~0.1-1 per star**

Thank you!
